The case for backend developers

First impressions are important, second impressions are everything. So it's time for some action. Let's stop talking and get some serious coding done. After all, that's what makes the world go round!

With the following assignment, you can show us what you got. The case tests your competences regarding development and gives us an idea on how well you come up with solutions.

Assignment

Create a simple website (this shows your back-end skills, not your front-end skills) on which you can search for movie data with the following criteria:

- Use an API of an online movie database (e.g. IMDB, Rotten Tomatoes or any other of your choosing) to retrieve the information;
- Show the result on the page;
- Use C# on .Net or .Net Core, whatever you prefer;

Tips

- Follow industry standards when building your application
- If you run into problems, you can check this YouTube channel for inspiration: https://www.youtube.com/channel/UC-ptWR16ITQyYOglXyQmpzw

Bonus

- Use an API of an online video service (e.g. YouTube or Vimeo) to show a trailer in the results;
- Make sure your website is secure and super fast;
- Surprise us! Build something we haven't thought of or what you think is a valuable addition;

Try to remember and briefly document the decisions you made and why you made them. We can't wait to pick your brain.

Kick some ass!
